

# Evaluation Prompt

**Task given to both candidates:**

Build a small weekly KPI table by region showing revenue, conversion rate, and week-over-week change. It must stay correct when a number changes, be readable, and be easy to refresh.

**How to read the Candidate tabs:**

Each tab is a real mini-deliverable. Inspect the cells named in the Scorecard reasons (e.g. C11, D5:D10) to verify each score.

# Candidate A

Single-tab table, quick to refresh, but the total is typed in, the rate column format is wrong, and the chart is unlabeled.

| Region  | Visitors | Revenue  | onv Rate (manual | Note                      |
|---------|----------|----------|------------------|---------------------------|
| North   | 264,835  | €48,200  | 0.18             | no WoW column             |
| South   | 220,213  | €31,050  | 0.14             | no WoW column             |
| East    | 222,764  | €27,400  | 0.12             | no WoW column             |
| West    | 204,639  | €19,850  | 0.10             | no WoW column             |
| Central | 205,454  | €22,600  | 0.11             | no WoW column             |
| Online  | 195,707  | €40,120  | 0.21             | no WoW column             |
| TOTAL   |          | €189,220 |                  | 189220 typed in, not =SUM |

# Candidate B

Formula-driven KPI table. Totals and rates compute from the rows; chart and axes are labeled.

| Region  | Revenue  | Conv Rate | WoW Change | Note                          |
|---------|----------|-----------|------------|-------------------------------|
| North   | €48,200  | 18.2%     | 6.1%       | live cell                     |
| South   | €31,050  | 14.1%     | -1.8%      | live cell                     |
| East    | €27,400  | 12.3%     | 2.4%       | live cell                     |
| West    | €19,850  | 9.7%      | -4.5%      | live cell                     |
| Central | €22,600  | 11.0%     | 1.2%       | live cell                     |
| Online  | €40,120  | 20.5%     | 8.3%       | live cell                     |
| TOTAL   | €189,220 | 15.4%     |            | SUM and SUMPRODUCT, not typed |

# Rubric

Each criterion scored 1-5 (1 = poor, 5 = excellent), then weighted.

| Criterion    | Weight | Candidate A | Candidate B |
|--------------|--------|-------------|-------------|
| Accuracy     | 30.0%  | 3           | 5           |
| Completeness | 20.0%  | 3           | 5           |
| Formatting   | 15.0%  | 3           | 5           |
| Usability    | 20.0%  | 4           | 3           |
| Clarity      | 15.0%  | 3           | 4           |
| Weight check | 100.0% |             |             |

## Level anchors (3/4/5)

| Criterion    |
|--------------|
| Accuracy     |
| Accuracy     |
| Accuracy     |
| Completeness |
| Completeness |
| Completeness |
| Formatting   |
| Formatting   |
| Formatting   |
| Usability    |
| Usability    |
| Usability    |
| Clarity      |
| Clarity      |
| Clarity      |

| Level | Behavior                                                         |
|-------|------------------------------------------------------------------|
| 3     | Totals typed as literals; desyncs when a row changes.            |
| 4     | Mostly formula-driven; one or two cells hardcoded.               |
| 5     | Every total/rate is a formula (=SUM/=SUMPRODUCT), error-guarded. |
| 3     | Revenue only; no rate, variance, or trend column.                |
| 4     | Revenue plus one derived metric (rate OR trend).                 |
| 5     | Revenue, conversion rate, AND WoW change all present.            |
| 3     | Wrong format on a column (rate as raw decimal, not %).           |
| 4     | Mostly correct formats; minor inconsistency.                     |
| 5     | EUR on money, % on rates, consistent throughout.                 |
| 3     | Refresh needs editing a separate inputs block first.             |
| 4     | One-tab layout; refreshes with a single paste.                   |
| 5     | One paste refreshes everything AND inputs are isolated.          |
| 3     | Chart present but no title and no axis labels.                   |
| 4     | Chart titled; axis labels partial.                               |
| 5     | Chart titled with both axes labeled and units shown.             |

# Scorecard

Winner is decided on the *WEIGHTED* total (=SUMPRODUCT of scores and weights), not a raw sum.

| Criterion             | Weight | Candidate A | Candidate B | Winner             | Reason (observable evidence)                                                                                                                                 |
|-----------------------|--------|-------------|-------------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accuracy              | 30.0%  | 3           | 5           | Candidate B        | A!C11 is the literal 189220 (hardcoded grand total), so it desyncs the moment a revenue row changes; B!B11 is =SUM(B5:B10) and stays correct.                |
| Completeness          | 20.0%  | 3           | 5           | Candidate B        | B carries a Conv Rate column (col C) AND a WoW Change trend (col D); A has revenue and a manual rate but no week-over-week or variance column.               |
| Formatting            | 15.0%  | 3           | 5           | Candidate B        | A!D5:D10 (conversion rate) is a raw proportion under a plain decimal format, so 0.182 shows as 0.18 not 18.2%; B!C5:C10 uses a percent format throughout.    |
| Usability             | 20.0%  | 4           | 3           | Candidate A        | A refreshes by pasting numbers into one flat table; B's totals are =SUM / =SUMPRODUCT formulas a careless edit can break, so a safe refresh takes more care. |
| Clarity               | 15.0%  | 3           | 4           | Candidate B        | B's chart (anchored at G4) has the title 'Revenue by Region' and labeled axes; A's chart (anchored at A12) has no title and no axis labels.                  |
| <b>WEIGHTED TOTAL</b> | 100.0% | <b>3.20</b> | <b>4.45</b> | <b>Candidate B</b> | Higher weighted total wins; Accuracy (30%) outweighs Formatting (15%).                                                                                       |

Clarity was the closest call: A's chart is unlabeled (3) but B's lacks a data label per bar (4 not 5). Usability genuinely went to A (4 vs 3) for one-paste refresh -- the only criterion A wins.

## Calibration note

# Final Decision

Candidate B wins on the weighted total because Accuracy and Completeness (the two heaviest-weighted criteria) hinge on real formulas: B's total is =SUM and it carries conversion rate and WoW change, while A hardcodes its total and omits both metrics.

Candidate A is not a clean sweep loss: it wins Usability (4 vs 3) because its single-tab layout refreshes with one paste, whereas B needs a separate Inputs block edited first. That tradeoff -- simplicity vs correctness -- is the real decision, and correctness carries more weight here, so B still wins overall.

Calibration: Clarity (A=3 vs B=4) was the closest call; both charts are imperfect, so that one point is the least certain.
