BUSINESS QUESTION

What is driving performance changes, and what should leadership do next?

Revenue across the 6-week window totals €125,836, at a 39.3% gross margin.

But the headline hides three uneven patterns by channel and region that this deck unpacks.

How we looked at it

- Reviewed 6 weeks of KPI data across 4 regions and 2 channels.
- Compared revenue, conversion, AOV, and margin by segment.
- Looked at trend, week-to-week variance, and contribution.
- Benchmarked each region against a company weekly target.

KEY INSIGHT 1

Revenue is far more volatile in Paid than Organic.

- Paid revenue swings 38% more, week to week, than organic.
- Paid variability (CV 37%) versus organic (CV 27%) means Paid drives most of the volatility in the top line.
- Organic is the steadier base; Paid is the lever and the risk.

KEY INSIGHT 2

Conversion is the bottleneck in the weakest region.

- West converts at 2.54%, the lowest of any region and well below North's 5.21%.
- Closing even half that gap is the single highest-leverage move on the board.
- Traffic is comparable across regions, so this is an execution gap, not a demand gap.

KEY INSIGHT 3

One region outperforms on conversion efficiency.

- North leads revenue at €46,612 and beats its weekly target by +48%.
- It converts best at 5.21%, the highest-efficiency region and the clearest lever to scale.
- West trails its target by -32% — the clearest place to intervene.

RECOMMENDATION

What leadership should do next

- Prioritize conversion fixes in West (worst at 2.54%).
- Reallocate attention toward North — the high-efficiency region.
- Treat Paid as the volatility lever; protect the organic base.
- Monitor weekly changes with the 6-week KPI pack.

Definitions, caveats, and source notes.

- Gross margin = $(\text{Revenue} - \text{Cost}) / \text{Revenue}$.
- Conversion rate = $\text{Conversions} / \text{Visitors}$. AOV = $\text{Revenue} / \text{Orders}$.
- CV = standard deviation / mean of per-region weekly revenue (volatility).
- Variance to target = $\text{avg weekly actual} / \text{company weekly benchmark} - 1$.
